Definition of S,A,B and C bugs

Definition of S, A, B, and C issues for release control

Severity	Definition	Examples
S - Safety ONLY	Defect has impact on safety of the End User or might create a dangerous situation.	*Examples:* • *RoadCheck wrong attribute applied to AutoStream Service resulting in vehicle to operate outside of designed domain* • *Not applying geo-fencing restrictions to roads (e.g. ignore prohibition of autonomous driving)*

A - Showstopper	Complete loss of functionality or data for any Map Data or Content or Software: • Most End Users who experienced the issue will complain • Brand image is severely damaged	• Major errors in functions that are used every trip • Failure to navigate a route, device does not start-up, black screen, device freeze, no map shown • Part of user interface is missing, blocking the access to main functions • No services available (Outage) *Examples:* • *Corrupted Map Data and no routing/guidance functionality can be offered* • *Search functionality doesn't give any result* • *Highway network disappeared from Map Data after update* • *Navigation crashes when End User operates the Head Unit* • *GPS signal not available for Software and Head Unit reboots* • *Traffic incidents are systematically displayed on wrong locations* • *Wrong/insufficient absolute accuracy* • *Unable to update map data* • *Unable to connect TomTom cloud services* • *AutoStream Service (server side) responds with wrong tiles based on correct request from client* • *RoadCheck attribute is incorrect* • *AutoStream client Software uses incorrect vehicle location data leading to a wrong tile response from AutoStream Service.*

B - Major	Other losses of functionality or data. • Some End Users experiencing the issue could complain • Performance degradation • Functionalities sometimes cannot be used	• Major errors in functions that are used every trip, but these errors occur only in occasional situations • Significant degradation in performance of main functions • Major errors in functions that are not frequently used • Errors requiring a reset before normal operation can be resumed *Examples:* • *Routing/Guidance calculation takes long to return results* • *Water areas are missing in Map Data of Florida* • *Duplication of road name on next instruction panel of the navigation application* • *50 mile stretch of interstate 75 missing in HD Map Data* • *Location specific map issue that results in disabling autonomous driving or that prevents enabling autonomous driving* • *KPI is outside acceptable range (e.g. response time of requests, error rates, read/write time of cache)*

C - Minor	Partial loss of functionality or data, incorrect functionality. • End Users will tolerate the defect or will not observe it	• Minor errors in functions frequently used, but these errors occur only in very rare situations • Localization or translation errors in menus, poor User Interface, old map data • Slight degradation in performance while KPI is still inside acceptable range • Issues not noticeable by end users *Examples:* • *Label of water area increased in font size* • *Interstate 75 road shield information does not fit in the next instruction panel design specification* • *Faster route timing miss match between different information panel* • *Overlapping UI elements (text + icons) in route bar* • *AutoStream client loads tiles two times and application build correct look ahead* • *At certain zoom levels city names are not displayed, but if user zooms in the city names are visible* • *Cosmetic issue*
